

## New Plant Care Guide

Congratulations on the installation of your new plants!

Here are a few tips/recommendations for the care of your new plants:

1. During the first few weeks, watering is essential, especially during the dry months of summer. Provide a deep watering 3 times per week. Do not overwater. When the ground is dry, the plant will need more water.
2. Your plant has been installed with fertilizer, enough to last the initial growing season. Consider additional fertilizer in the spring of the year following the installation.
3. Perennials, shrubs, and trees will follow the rule:  
First year it sleeps, second year it creeps, third year it leaps!
4. Perennials, Annuals and flowers will need more watering while in bloom.

We have worked hard to establish a reputation for quality. We look forward to showing you that it is well deserved.
